1.   A method for segmentedly encrypting the data in a document print job in a manner which preserves options for post-rendering analysis/processing of selected non-content components comprising

identifying and individuating within such a job the content commands as distinguished from the non-content commands, and

as a consequence of said identifying and individuating, encrypting only data contained within the content commands.

2.   The method of claim 1, wherein said encrypting is performed with respect to the entirety of such content commands.

3.   The method of claim 1 which further comprises identifying and individuating, within such content commands, the content-field portions of those commands, and wherein said encrypting is performed only with respect to such content-field portion(s).

4.   A segmentedly encrypted document print job comprising

an encrypted part which includes only data contained within an content commands that form components of the job, and

a non-encrypted part which includes the balance of data contained within the job.

5.   The print job of claim 4, wherein the content command components of the job include content-field portions and non-content-field portions, and said encrypted part includes only said content-field portions.
